

AUTOMOBILE DASHBOARD ANALYSIS

A robust teaching-learning platform dedicated for you to gain the industrial skills and know

Objective :

The primary objective of the analysis is to gain insights into the sales performance of different car brands across various countries, track sales trends over time, and identify patterns and relationships in the dataset. This can help in understanding customer preferences, optimizing inventory, and improving sales strategies.

The dataset includes various columns that provide detailed information about car sales, including financial aspects (sale price, cost price, discounts), logistical aspects (delivery charges, spare parts, labor costs), client details, and vehicle details (make, model, color, type). This comprehensive data allows for in-depth analysis of sales performance, cost management, and customer preferences across different regions and time periods.

Key Analysis:

- Total sales for each year using DAX
- Measure to calculate the average sales per month.
- Cumulative total of sales over months
- DAX formula to calculate the Year-to-Date (YTD) sales.
- The percentage growth in sales compared to the previous year
- Measure to calculate the total sales for the last 12 months.
- Calculate the highest sales month using DAX

Key Insights:

- Identifies monthly/yearly sales fluctuations and peak sales periods to forecast future demand.
- Analyzes top-performing vehicle types and models, highlighting popular specifications.
- Measures sales performance differences between recession periods and non-recession periods.
- Visualizes sales performance by geographical location or dealership using interactive maps.
- Tracks essential metrics like total units sold, total revenue, and average price per unit.
- Evaluates profitability based on price variation, fuel type, transmission, and vehicle engine size.
- Links advertising expenditure to sales revenue to measure marketing ROI
